

IITDESIGNBUILD PAVILLION IN INDIA

DESIGN-BUILD STUDIO PROJECT OF THE ILLINOIS INSTITUTE OF TECHNOLOGY COLLEGE OF ARCHITECTURE

ADDRESS:
CHANDEWADI, MANGAON DISCTRICT, INDIA

PROJECT DESCRIPTION

The initiative of the 2024 Illinois Institute of Technology (IIT) Design/Build Studio is the design and building of a sewing pavilion. This pavilion will be located in Chandewadi, Mangaon district, in India, about 139 km from the capital city of Bombay (Mumbai). This project will empower the community and enrich lives through well-designed, functional architecture.

The decision to create a sewing pavilion is particularly impactful as it aligns with the broader goals of India of empowering women, in particular, fostering community, and preserving cultural traditions. Sewing, beyond being a practical skill, is a medium by which stories and traditions are passed down through generations. It is a skill that not only binds communities, but also offers a significant possibility for economic independence.

The pavilion's placement at the village's northern corner allows the building to act as a gateway between the main road State Highway 96 and the village. The design is organized into three distinct, yet interconnected spaces; the main sewing area, the kitchen, and the washroom. These spaces are not only architectural elements, but also reflect an understanding of the social activities and practical aspects of living in the village. The inclusion of a kitchen signifies the importance of communal gatherings and the sharing of meals, further emphasizing the pavilion's role as a safe, nurturing space for women.

Given that the site is in India, gave the team the opportunity to investigate a design that responded to the culture. The use of bricks made locally ensures that the structure harmonizes with its environment while also supporting the local craftspeople and economy. The creation of perforated walls for natural ventilation is a traditional methodology, while the roof ventilation is a modern engineering solution. Thus, old and new, traditional and contemporary, are blended to create a building that fits modestly into its surroundings, while addressing pragmatic concerns with the best tools available.
